

Food In Motion

The team guide: setup, planning, deliveries, and the food log

Food In Motion is the board for a food delivery team. It replaces the group chat full of "I am done with this spot" messages. Every driver runs their day from one screen: the stops, the meals, the food that went out, and one big DONE button. When a stop is finished, the app writes the update for the driver, worded and ready to send to the team.

What you can use it to do

- Plan the whole week, day by day, and change it any time. Nothing about the plan is automatic. People place every stop.
- Give one stop one meal, two meals, or all three: Breakfast, Lunch, and Dinner in any mix.
- Keep a profile for each driver, name and photo, so the team board shows who is who.
- Log the food on every stop: the protein, the starch, the greens, the vegetables, the fruit, and the temperature.
- Tap DONE once and get a written update to send to the team chat. No typing the same message over and over.
- Keep a permanent log of every delivery: the day, the time, the place, the meals, and the food, ready to look back on.

Get it on your phone

There is nothing to install and nobody signs up. Open this link in the phone browser:

https://raw.githack.com/sinhara666/food-in-motion/1f4bb18ed053a160cd84d43d9d9cbadd7cbd0117/index.html

Tip: use the browser menu and choose Add to Home Screen. It puts the app on the phone like any other app, one tap to open. Each driver does this on their own phone.

Set it up the first time

Step 1. Open the Setup tab

It is the last tab at the top.

Step 2. Add your photo and your name

Tap Add your photo and pick a picture. The app shrinks it small and keeps it on your phone. Then type your name under Your name. Your card on the Team Board shows your photo, your name, and how many of today's stops you have finished.

Step 3. Save your regular places

At the bottom of Setup, under New saved place, type the name and address of each place the team delivers to, and tap Save this place. Do this once. Saved places stay for good and are the building blocks of every week plan.

Step 4. Clear the examples, when ready

The app starts with example drivers and example places so you can see how it works. The example drivers come off with the Remove the example drivers button in Setup. Example places come off with the Remove button next to each one.

Step 5. Tap Save setup

That stores your name and settings on this phone.

Plan the week

Open the Week Plan tab. Across the top are the days, Monday to Sunday.

Step 1. Pick a day

Tap the day you want to plan.

Step 2. Add stops

Under All your places, tap Add to that day on each place that runs that day. Every place you add gets its own card on that day.

Step 3. Set the meals on each card

On the card, tap Breakfast, Lunch, or Dinner to switch that meal on. Tap again to switch it off. A card can carry one meal, two meals, or all three, whatever that place is getting that day.

Step 4. Say what gets dropped off

The box on the card is for the load: how many meal boxes, trays, bags, anything the driver needs to know before they roll. It is optional.

Step 5. Move a stop when the plan changes

Prev day and Next day slide a card to the day beside it. The X takes a stop off that day. The place itself stays saved, only that day's card goes away.

Run today's route

Open My Route. It shows today's stops from the Week Plan, in order, with how many are done.

Step 1. Fill in the food on the stop

Every stop card has a Food on this stop box. Type what is actually being served, in your own words, in the section it belongs to: Protein, Starch, Greens, Vegetables, Fruit. Salads go under

Greens. Cooked vegetables like green beans or corn go under Vegetables. Then take the temperature and type it in the Temperature box.

Step 2. Watch the temperature

Hot food should hold at 140 degrees or above. If a temperature under 140 goes in, the app flags it in red, on the card and later in the Log, so somebody sees it and can act.

Step 3. Tap DONE

One tap. The stop marks delivered with the time, and the app writes the update for you: your name, the stop number, the place, the meals, the protein, the temperature, and how many stops are done out of the total.

Step 4. Send the update

Tap Send to Messenger. The app copies the update and opens Messenger, you paste it into the group chat and send. Or tap Copy and paste it anywhere. Made a mistake? Tap Undo on the stop and it comes right back off, update, log entry, and all.

The Team Board

The Team Board tab shows a card for every driver: photo, name, and stops done out of stops planned, with a progress bar. Under the cards, Latest updates lists every finished stop as it happens. Right now each phone keeps its own copy of the app, so the board on your phone shows your card and your updates. The shared board, where every driver sees everybody live on one screen, is a separate build for later.

The Log

The Log tab is the permanent record. Every DONE tap lands here and stays: the date, the day, the time, the place, the meals, the food that went out, and the temperature, grouped by day with a count of stops. Type a place name in the search box to pull up every delivery ever made to that place. This is the page to open when anyone asks what went where, and when.

Good habits

- Fill the food boxes in at the stop, while the food is in front of you, not at the end of the day.
- Take the temperature when the food goes out, the same way every time, so the numbers mean something.
- Keep place names spelled one way. The Log search finds a place by its name.
- Fix mistakes with Undo right away. A clean log is the whole point.

The assistant: tell it, and it sets it up

The Assistant tab is the chatbot. Instead of tapping through every screen, tell it what you need, out loud with the mic button or typed in the box, and it does the setting up. Then it tells you back exactly what it changed.

- Save a new place: "Add Federal Way High School, 30611 16th Ave S."
- Put stops on days: "Put Lincoln on Tuesday for lunch and dinner, 15 snack packs."
- Change meals, move a stop to another day, take a stop off, or clear a whole day.
- Mark a stop delivered: "Mark Maple Street done."
- Ask about the plan: "What is on Thursday?" It answers from the real plan.

The first time, the assistant asks for a key. It runs on a free Groq key, yours, pasted once in the Assistant tab and kept on your phone only. Get one at console.groq.com: sign up free, open API Keys, create one, copy it, paste it in. After that, just talk to it. It only does what it is told. Nothing in the plan changes unless a person sets it or tells the assistant to.

The boss dashboard

There is a second page made for the boss, the coordinator, whoever runs the team. It reads the same information the app keeps, and lays it out for looking, not doing. Open it from the Setup tab, the black Boss Dashboard button, or ask for its link.

- Today at a glance: stops done out of stops planned, how many temperatures got logged, and how many came in low.
- A temperature watch that names any stop where hot food went out under 140 degrees.
- Every stop for today with its meals, its food, and whether it is delivered yet, and at what time.
- Every driver card with photo and progress, the whole week plan on one screen, and the full delivery records with a search box.
- A Print button at the bottom, for paper records. Grants, inspections, or anyone who asks what went where: print the records page.

Like the app, the boss page on one phone shows what that phone has. A single live board that pulls every driver together is the shared build, a separate step for later.

What it does not do

- No accounts and no passwords. Your name and photo live on your own phone.
- It does not move stops around by itself. People control where every card sits, by hand or by telling the assistant.
- It does not post to Messenger by itself. It writes the update, you paste and send.
